

DIGITAL CAMERA HAVING A TILTING/SWINGING MECHANISM

ABSTRACT OF THE DISCLOSURE

A digital camera includes a photographic lens that is
5 provided on a camera body of the digital camera so that
an optical axis of the photographic lens is stationary with
respect to the camera body; an image pick-up element on
which an image of an object to be photographed, which is
formed through the photographic lens, is impinged; and a
10 tilting/swinging mechanism, provided in the camera body,
for tilting and/or swinging the image pick-up element
relative to a plane orthogonal to the optical axis.
